

Truss Jibs

Truss Jibs - A truss jib is actually utilized to carry and position trusses. It is actually an extended jib additional part that is equipped along with a pyramid or triangular shaped frame. Typically, truss jibs are mounted on machines such as a skid steer loader, a compact telehandler or even a forklift making use of a quick-coupler attachment.

Older style cranes that have deep triangular truss jibs are normally assemble and fastened with bolts and rivets into standard open structural shapes. There are rarely any welds on these kind jibs. Each and every riveted or bolted joint is prone to corrosion and therefore needs regular maintenance and inspection.

Truss jibs are designed with a back-to-back arrangement of lacing members separated by the width of the flange thickness of another structural member. This particular design causes narrow separation amid the flat surfaces of the lacings. There is little room and limited access to preserve and clean them against corrosion. Lots of rivets become loose and rust within their bores and must be replaced.
